Professional Summary

Engineer building AI-powered software, backend systems, and technical tools. Experienced in Python automation, cybersecurity, digital forensics, and systems engineering, with a background in Industrial IoT. A builder by nature, I enjoy learning unfamiliar technologies, tackling ambiguous problems, and turning ideas into working software, with a strong drive to grow alongside fast-moving engineering teams.

Experience

Intern — AbyM Technologies

Feb 2026 – May 2026

Remote, Noida, India

- Executed structured vulnerability assessments across internal infrastructure using automated scanning pipelines; identified, classified, and prioritized security weaknesses before production deployment.
- Partnered with infrastructure teams to document remediation workflows and implement security controls, reducing exploitable attack surface across live systems.

Intern — National Cyber Forensics Lab (IFSO), Delhi Police

Jul 2025 – Oct 2025

Delhi, India

- Conducted digital forensic analysis on Windows endpoints, examining registry hives, event logs, and filesystem artifacts to support active criminal investigations.
- Built Python automation scripts for forensic artifact collection and log analysis, reducing repetitive manual investigation workflows.
- **Received a formal Appreciation Letter from Delhi Police** for contributions to forensic tooling and security automation.

Selected Projects

AI OS — AI-Powered Lifestyle System

🐙 GitHub

- Building an AI-powered application using Next.js, Supabase/PostgreSQL, authentication, and LLM integrations to provide personalized user experiences.
- Designing an AI architecture separating deterministic application logic from LLM reasoning, with persistent user context, structured outputs, and secure data access.

Atlas — Backend Engineering System

🐙 GitHub

- Built a backend application using FastAPI, SQLAlchemy, PostgreSQL, and Alembic, implementing REST APIs, authentication, database relationships, migrations, and CRUD workflows.
- Applied production-oriented practices including Dockerized development, database migrations, ownership-based data access, automated testing, and API design.

ThreatMap — AI-Powered Security Assessment Engine

🐙 GitHub

- Architected a terminal-first security assessment engine orchestrating Nmap, Nuclei, Nikto, Gobuster, Subfinder, and SSLScan through parallel execution pipelines with local SLM-based AI triage.
- Built automated HTML, Excel, and JSON reporting from raw scan data with structured risk prioritization; shipped v1.0 for security assessment preparation.

Win_Forensics — Windows Digital Forensics Toolkit

🐙 GitHub

- Reverse-engineered Windows application encryption workflows, analyzing DPAPI-protected keys and encrypted SQLite databases using AES-OFB.
- Built a forensic parser producing structured JSON and packaged the toolkit as a portable executable for field use.

Technical Skills

Languages: Python, TypeScript, JavaScript, SQL, Bash

Backend: FastAPI, REST APIs, Next.js, PostgreSQL, MySQL, SQLAlchemy, Alembic

AI Engineering: LLM Integration, Structured Outputs, Prompt Engineering, AI Application Development

Infrastructure: Docker, Linux, Git, CI/CD, Vercel

Security & Systems: Vulnerability Assessment, Digital Forensics, Security Automation, Networking, IIoT Architecture

Education

Vivekananda Institute of Professional Studies, Delhi

2026

Bachelor of Technology in Computer Science & Engineering (Industrial IoT)
